Manufacturer's Declaration on the Definition of VOC – ELAPRO QuickRepair

Dear Sir or Madam,

volatile organic compounds (VOC) are defined in accordance with the Decopaint Directive (Directive 2004/42/EC). This includes all organic compounds with an initial boiling point below 250 °C at a standard pressure of 101.3 kPa.

In all cases, the functions of the raw materials used must be examined. If the compounds participate in the curing process through a chemical reaction, they become part of the cured liquid-applied waterproofing product and are therefore no longer classified as VOCs.

The formulation of ELAPRO QuickRepair contains a chemical compound that participates in the curing process through a chemical reaction and thus becomes part of the cured product.

Yours sincerely,

Dr. Janek Rausch
